

VBS IS A LEADER IN VACUUM INSULATED CLOSED LOOP LN₂ PIPING SYSTEMS FOR MBE APPLICATIONS

With over 20 years experience in system design, installation and service, VBS is at the forefront of LN₂ closed loop piping systems for MBEs.

Our turnkey vacuum jacketed LN₂ piping systems incorporate:

System Design

VBS will work with your end users and facilities staff to design an appropriate, state of the art, LN₂ piping system that will meet your budget *and* your specific MBE requirements.

VBS has over twenty years of experience designing and installing LN₂ systems for MBEs.

Our systems are built to last a lifetime. In fact, we are so confident about the quality of our product, we offer a full 3-year warranty with each system we install.

With Room To Grow

We realize that companies need the ability to change and expand without jeopardizing initial capital investments. All VBS piping systems are completely 100% modular.

- If your expansion takes you to a new location, VBS engineers will work with you to use the components of your existing system in designing a new system.
- If your system simply needs an addition, VBS will provide you with the most economical solution available. Each system can be expanded at any system bayonet joint.

Complete System Approach

In addition to dimensioning and designing your system, VBS engineers will work directly with your liquid supplier and MBE manufacturer to ensure a seamless installation.

Training

Our job is not complete until you and your staff understand the PM requirements and safety awareness needed to maintain a vacuum-jacketed LN₂ piping system.

- VBS technicians will provide training during the installation process.
- We will work with you to establish maintenance protocols that ensure a trouble free system for a lifetime.

Emergency Support

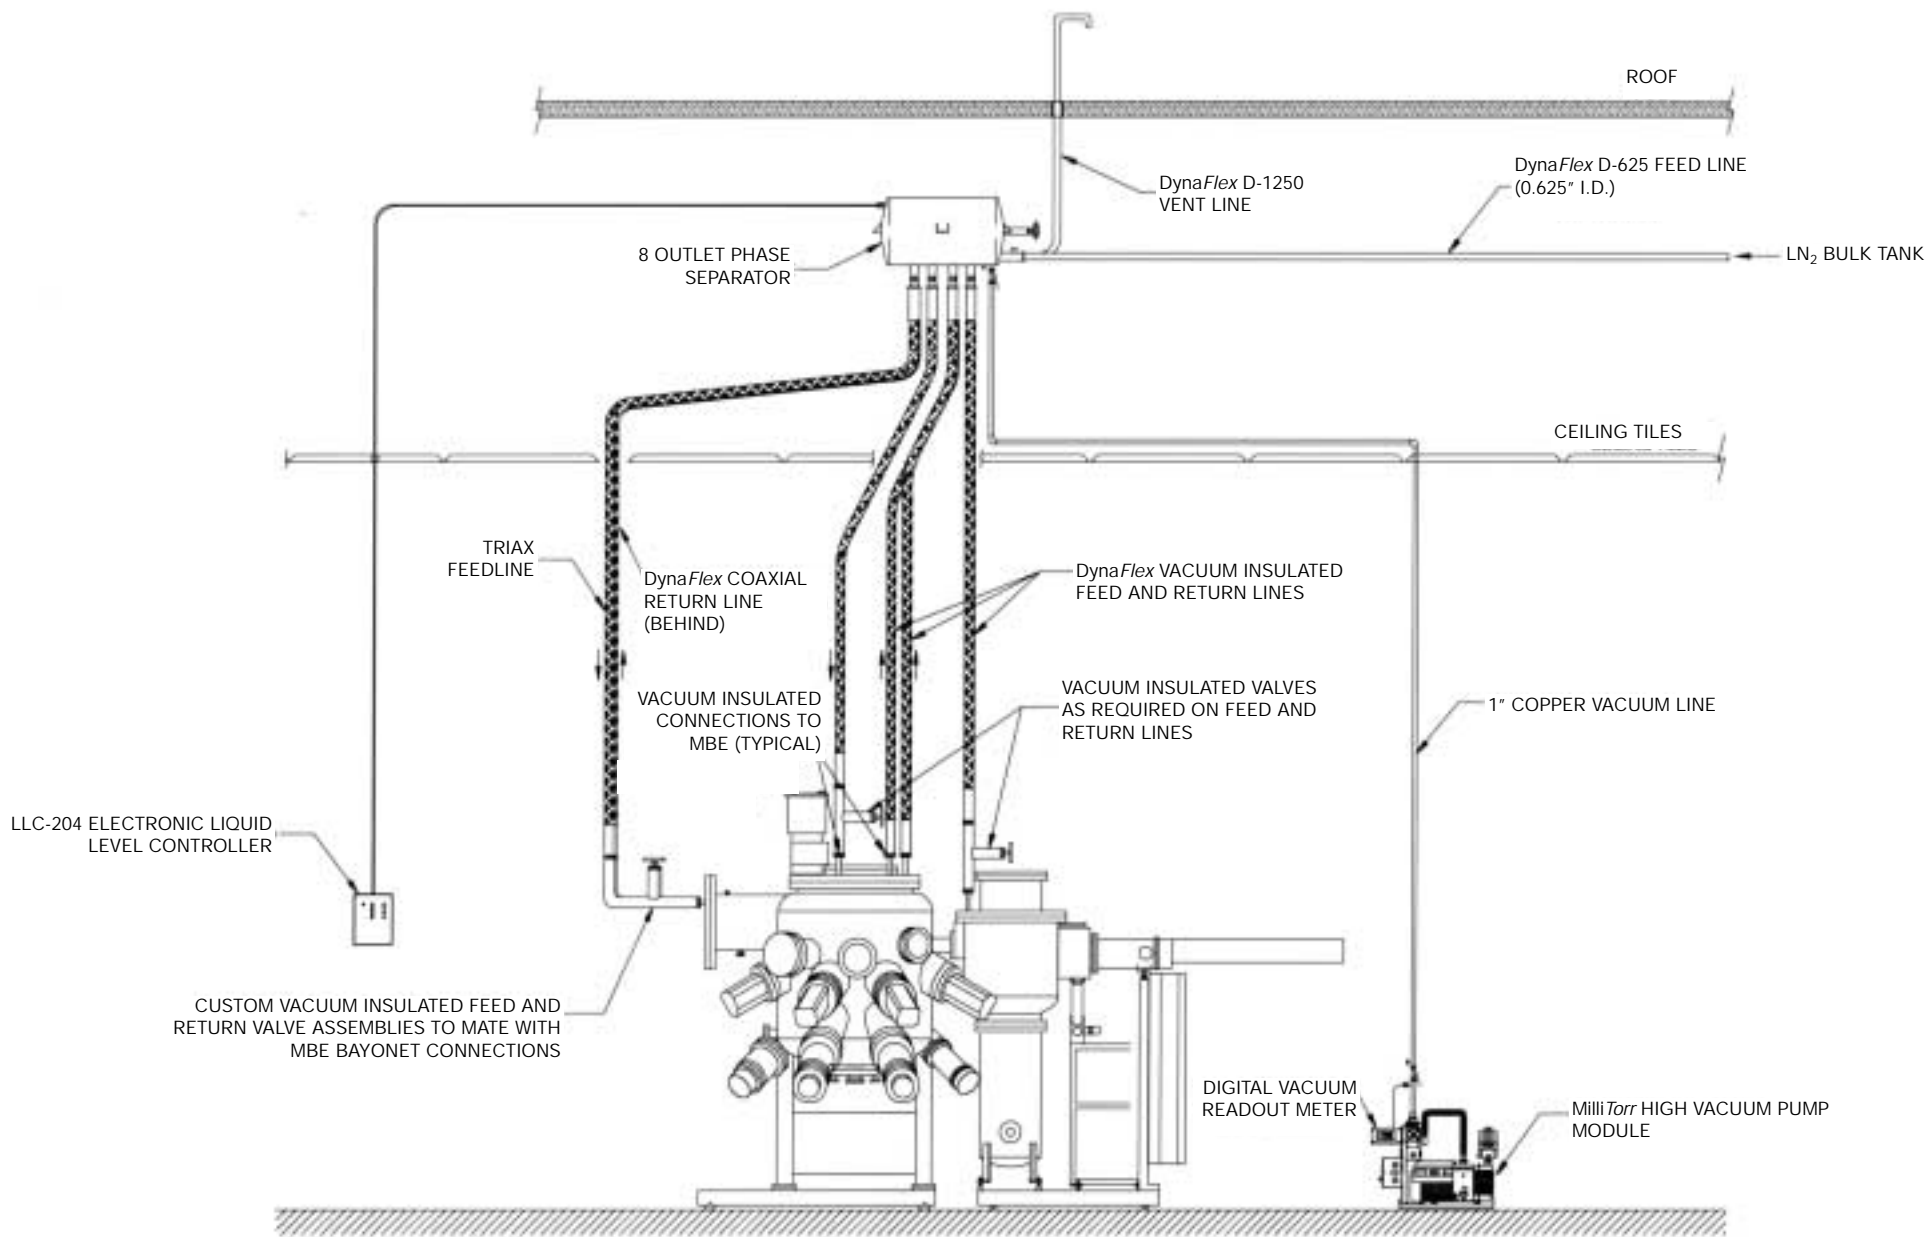

While we are strong proponents of a proactive routine maintenance approach, we realize that the unexpected can happen. When it does, VBS is available to lend an ear, a helping hand, or on-site support. Whatever the situation, you can depend on VBS.
